

Step 3: Normalization

We add simpler derived clauses:

$$head \quad \leftarrow \quad p(a\ w),\ rest$$

$$p(a\ X) \quad \leftarrow \quad p_1(X), \dots, p_r(X)$$

implies:

$$head \quad \leftarrow \quad p_1(w), \dots, p_r(w),\ rest$$

$$p(X) \quad \leftarrow \quad p_1(X), \dots, p_m(X)$$

$$p_i(a\ X) \quad \leftarrow \quad p_{i1}(X), \dots, p_{ir_i}(X)$$

implies:

$$p(a\ X) \quad \leftarrow \quad p_{11}(X), \dots, p_{mr_m}(X)$$

Step 3 (Cont.): Normalization

$head \leftarrow p(w), rest$

$p(X) \leftarrow$ implies:

$head \leftarrow rest$

$head \leftarrow p(b), rest$

$p(b) \leftarrow$ implies:

$head \leftarrow rest$

$p() \leftarrow p_1(X), \dots, p_m(X)$

$p_i(a X) \leftarrow p_{i1}(X), \dots, p_{ir_i}(X)$

implies:

$p() \leftarrow p_{11}(X), \dots, p_{mr_m}(X)$

Example:

$$\text{add}_1(X) \leftarrow \text{add}_0(X)$$

$$\text{add}_0(0) \leftarrow$$

$$\text{add}_1(X) \leftarrow \text{add}_1(X)$$

$$\text{add}_1(s_1 X) \leftarrow \text{add}_1(X)$$

... results in the new clause:

$$\text{add}_1(0) \leftarrow$$

Theorem

Assume that $\mathcal{C}$ is a finite set of clauses for which steps 1 and 2 have been executed and which then has been saturated according to step 3.

Assume that $\mathcal{C}_0 \subseteq \mathcal{C}$ is the subset of normal clauses of $\mathcal{C}$. Then for all occurring predicates p ,

$$\llbracket p \rrbracket_{\mathcal{C}_0} = \llbracket p \rrbracket_{\mathcal{C}}$$

Proof:

Induction on the depth of terms in $\llbracket p \rrbracket_{\mathcal{C}}$:-)

... in the Example:

For $\text{add}_1(X)$ we obtain the following clauses:

$$\text{add}_1(0) \leftarrow$$

$$\text{add}_1(s_1 X) \leftarrow \text{add}_1(X)$$

These clauses are already normal :-)

Transforming into Normal Clauses:

Introduce new predicates for **conjunctions** of predicates.

Assume that $A = \{p_1, \dots, p_m\}$. Then:

$[A](b) \leftarrow$ whenever $p_i(b) \leftarrow$ for all i .

$[A](a\ X) \leftarrow [B](X)$ whenever $B = \{p_{ij} \mid i = 1, \dots, m\}$ for
 $p_i(a\ X) \leftarrow p_{i1}(X), \dots, p_{ir_i}(X)$

Last Step: Transformation into a Type

- First, the automaton is determinized ...

Last Step: Transformation into a Type

- First, the automaton is determinized ...
- Then transitions for the components of constructors a :

$$p(a_j X) \leftarrow p^{(j)}(X)$$

are joined into a transition for a :

$$p(a(X_1, \dots, X_k)) \leftarrow p^{(1)}(X_1), \dots, p^{(k)}(X_k)$$

- Finally, the predicates p_j for the components of the predicate p/k are joined to a transition:

$$p(X_1, \dots, X_k) \leftarrow p_1(X_1), \dots, p_k(X_k)$$

In the Example we find:

$$\begin{aligned}\text{add}(X, Y, Z) &\leftarrow \text{add}_1(X), \text{nat}(Y), q'(Z) && \text{where} \\ q'(0) &\leftarrow \\ q'(s\ X) &\leftarrow q'(X) \\ q' &= \{\text{nat}, \text{add}_2\}\end{aligned}$$

In the Example we find:

$$\begin{aligned}\text{add}(X, Y, Z) &\leftarrow \text{add}_1(X), \text{nat}(Y), q'(Z) && \text{where} \\ q'(0) &\leftarrow \\ q'(s\ X) &\leftarrow q'(X) \\ q' &= \{\text{nat}, \text{add}_2\}\end{aligned}$$

The types $\text{add}_1, q', \text{nat}$ are all equivalent :-)

Discussion:

- For type-checking, it suffices to check for every predicate p/k that

$$\llbracket p_i \rrbracket_{c^\#} \subseteq \Pi(T_i)$$

- Since the T_i are topdown deterministic, we have a deterministic automaton for $\Pi(T_i)$:-)
- Therefore, we can easily construct a DFA for the complement $\overline{\Pi(T_i)}$!!
- Then we check whether

$$\llbracket p_i \rrbracket_{c^\#} \cap \overline{\Pi(T_i)} = \emptyset$$

$\implies$ this saves us determinization :-))

Warning:

- The emptiness problem for APS is DEXPTIME-complete !
- In many cases, though, our method terminates quickly ;-)

Warning:

- The emptiness problem for APS is DEXPTIME-complete !
 - In many cases, though, our method terminates quickly ;-)
-
- Inferred types can also be used to understand legacy code.
 - Then, however, they are only useful if they are not too complicated !
 - Our type inference provides very precise information :-)
 - In practical applications, further widenings are applied to accelerate the analysis, e.g., by reducing the number of occurring sets.

5.3 Goal-directed Type Inference

Prolog programs explore predicates only insofar as they contribute to answer a query.

Example: `append`

```
app([], Y, Y)           ←  
app([H|T], Y, [H|Z])    ←  app(T, Y, Z)  
                        ←  app([1, 2], [3], Z)
```

... results in:

The *APS*-Approximation

$$\text{app}_1([[]]_1(H)) \leftarrow \text{app}_1(T), \text{app}_2(Y), \text{app}_3(Z).$$

$$\text{app}_1([[]]_2(T)) \leftarrow \text{app}_1(T), \text{app}_2(Y), \text{app}_3(Z).$$

$$\text{app}_2(Y) \leftarrow \text{app}_1(T), \text{app}_2(Y), \text{app}_3(Z).$$

$$\text{app}_3([[]]_1(H)) \leftarrow \text{app}_1(T), \text{app}_2(Y), \text{app}_3(Z).$$

$$\text{app}_3([[]]_2(Z)) \leftarrow \text{app}_1(T), \text{app}_2(Y), \text{app}_3(Z).$$

$$\text{app}_1([]) \leftarrow$$

$$\text{app}_2(X) \leftarrow$$

$$\text{app}_3(X) \leftarrow$$

$$\begin{aligned} &\leftarrow \text{app}_1([[]]_1(1)), \text{app}_1([[]]_2([[]]_1(2))), \text{app}_1([[]]_2([[]]_2([]))), \\ &\text{app}_2([[]]_1(3)), \text{app}_2([[]]_2([])), \text{app}_3(X) \end{aligned}$$

Ignoring the query, we find via normalization:

$$\begin{aligned}
\text{app}_2(X) &\leftarrow \\
\text{app}_3(X) &\leftarrow \\
\text{app}_1([]) &\leftarrow \\
\text{app}_1([[]]_2 X) &\leftarrow q_0(X) \\
\text{app}_1([[]]_2 X) &\leftarrow q_1(X) \\
\text{app}_1([[]]_2 X) &\leftarrow q_2(X) \\
\text{app}_1([[]]_1 X) &\leftarrow \\
q_0([]) &\leftarrow \\
q_1([[]]_2 X) &\leftarrow q_0(X) \\
q_1([[]]_2 X) &\leftarrow q_1(X) \\
q_1([[]]_2 X) &\leftarrow q_2(X) \\
q_2([[]]_1 X) &\leftarrow
\end{aligned}$$

Discussion

- The second and third argument can be arbitrary.
- The first argument is a list where nothing is known about the elements :-)
- Ignoring the query, this result is the best we can hope for :-)
- Better results can be obtained if additionally **call patterns** are tracked !

⇒ Magic Set Transformation

Magic Sets

- For every predicate p/k , we introduce a new predicate called_p/k with the clauses

$$\text{called}_p(\underline{t}) \leftarrow \text{for the query } \leftarrow p(\underline{t})$$

•

$$\text{called}_{p_i}(\underline{t_i}) \leftarrow \text{called}_p(\underline{t}), p_1(\underline{t_1}), \dots, p_{i-1}(\underline{t_{i-1}})$$

$$p(\underline{t}) \leftarrow \text{called}_p(\underline{t}), p_1(\underline{t_1}), \dots, p_m(\underline{t_m})$$

for every clause:

$$p(\underline{t}) \leftarrow p_1(\underline{t_1}), \dots, p_m(\underline{t_m})$$

Example: **append** (Cont.)

app([], Y, Y) $\leftarrow$ **called**([], Y, Y)

app([H|T], Y, [H|Z]) $\leftarrow$ **called**([H|T], Y, [H|Z]),
app(T, Y, Z)

called(T, Y, Z) $\leftarrow$ **called**([H|T], Y, [H|Z])

called([1, 2], [3], Z) $\leftarrow$

The *APS*-Approximation:

$$\begin{aligned} \text{app}_1([]) &\leftarrow \text{called}_1([], \text{called}_2(X), \text{called}_3(X)) \\ \text{app}_2(X) &\leftarrow \text{called}_1([], \text{called}_2(X), \text{called}_3(X)) \\ \text{app}_3(X) &\leftarrow \text{called}_1([], \text{called}_2(X), \text{called}_3(X)) \\ \text{app}_1([]_1 H) &\leftarrow \text{called}_1([]_1 H, \text{called}_1([]_2 T), \text{called}_2(Y), \text{called}_3([]_1 H), \text{called}_3([]_2 Z), \\ &\quad \text{app}_1(T), \text{app}_2(Y), \text{app}_3(Z)) \\ \text{app}_1([]_2 T) &\leftarrow \text{called}_1([]_1 H, \text{called}_1([]_2 T), \text{called}_2(Y), \text{called}_3([]_1 H), \text{called}_3([]_2 Z), \\ &\quad \text{app}_1(T), \text{app}_2(Y), \text{app}_3(Z)) \\ \text{app}_2(Y) &\leftarrow \text{called}_1([]_1 H, \text{called}_1([]_2 T), \text{called}_2(Y), \text{called}_3([]_1 H), \text{called}_3([]_2 Z), \\ &\quad \text{app}_1(T), \text{app}_2(Y), \text{app}_3(Z)) \\ \text{app}_3([]_1 H) &\leftarrow \text{called}_1([]_1 H, \text{called}_1([]_2 T), \text{called}_2(Y), \text{called}_3([]_1 H), \text{called}_3([]_2 Z), \\ &\quad \text{app}_1(T), \text{app}_2(Y), \text{app}_3(Z)) \\ \text{app}_3([]_2 Z) &\leftarrow \text{called}_1([]_1 H, \text{called}_1([]_2 T), \text{called}_2(Y), \text{called}_3([]_1 H), \text{called}_3([]_2 Z), \\ &\quad \text{app}_1(T), \text{app}_2(Y), \text{app}_3(Z)) \end{aligned}$$

...

$\text{called}_1(T)$	$\leftarrow$	$\text{called}_1([]_1 H), \text{called}_1([]_2 T), \text{called}_2(Y), \text{called}_3([]_1 H), \text{called}_3([]_2 Z)$
$\text{called}_2(Y)$	$\leftarrow$	$\text{called}_1([]_1 H), \text{called}_1([]_2 T), \text{called}_2(Y), \text{called}_3([]_1 H), \text{called}_3([]_2 Z)$
$\text{called}_3(Z)$	$\leftarrow$	$\text{called}_1([]_1 H), \text{called}_1([]_2 T), \text{called}_2(Y), \text{called}_3([]_1 H), \text{called}_3([]_2 Z)$
$\text{called}_1([]_1 1)$	$\leftarrow$	
$\text{called}_1([]_2 ([]_1 2))$	$\leftarrow$	
$\text{called}_1([]_2 []_2 [])$	$\leftarrow$	
$\text{called}_2([]_1 3)$	$\leftarrow$	
$\text{called}_2([]_2 [])$	$\leftarrow$	
$\text{called}_3(X)$	$\leftarrow$	

The Normalized *APS*-Approximation (Cont.)

$\text{app}_1([\]_1 X) \leftarrow q_1(X)$	$\text{app}_3([\]_1 X) \leftarrow q_3(X)$	$q_4([\]_2 X) \leftarrow q_0(X)$
$\text{app}_1([\]_1 X) \leftarrow q_2(X)$	$\text{app}_3([\]_2 X) \leftarrow q_0(X)$	$q_5([\]_1 X) \leftarrow q_2(X)$
$\text{app}_1([\]) \leftarrow$	$\text{app}_3([\]_2 X) \leftarrow q_4(X)$	$q_6([\]_1 X) \leftarrow q_3(X)$
$\text{app}_1([\]_2 X) \leftarrow q_4(X)$	$\text{app}_3([\]_2 X) \leftarrow q_6(X)$	$q_7([\]_1 X) \leftarrow q_1(X)$
$\text{app}_1([\]_2 X) \leftarrow q_0(X)$	$\text{app}_3([\]_2 X) \leftarrow q_7(X)$	$q_7([\]_1 X) \leftarrow q_2(X)$
$\text{app}_1([\]_2 X) \leftarrow q_5(X)$	$\text{app}_3([\]_2 X) \leftarrow q_8(X)$	$q_8([\]_2 X) \leftarrow q_4(X)$
$\text{app}_2([\]_1 X) \leftarrow q_3(X)$	$q_0([\]) \leftarrow$	$q_8([\]_2 X) \leftarrow q_7(X)$
$\text{app}_2([\]_2 X) \leftarrow q_0(X)$	$q_1(1) \leftarrow$	$q_8([\]_2 X) \leftarrow q_8(X)$
$\text{app}_3([\]_1 X) \leftarrow q_1(X)$	$q_2(2) \leftarrow$	$q_8([\]_2 X) \leftarrow q_6(X)$
$\text{app}_3([\]_1 X) \leftarrow q_2(X)$	$q_3(3) \leftarrow$	

Discussion

- The result now is amazingly precise !!
- The correct values for the second parameter is inferred.
- For the result parameter, a list containing 1,2 and 3 is inferred.
- It only fails to infer that this list is finite and of length 3 :-)
